

2nd February 2026

ASX Market Announcements

**DRILLING COMPLETED FOR RARE EARTH ELEMENTS EXPLORATION
AT LAMEROO, COODALYA, AND KARTE, MALLEE PROJECT, SOUTH AUSTRALIA**

Kaili Resources Limited (“Company”) is pleased to announce that the Aircore drilling was completed on the 1st February 2026 at the Mallee Project - Lameroo EL 6856, Coodalya EL 6978 and Karte EL 6977 tenements within the Murray Basin in South Australia (**Figure 1**). The 3 tenements are approximately 200 kms east of Adelaide accessible by highway and overlay the Loxton/Parilla Sands (**Figure 2**) of the region. Rare Earth Elements (“REEs”) are reportedly contained within the fine clay fraction of Tertiary (65 to 2.5 Million Years Ago) Strandlines (ionic clay style of deposit) in the basin.

Australian Rare Earths (ASX:AR3) has reported exploration success within their tenements in the region with estimated JORC 2012 resource of 236 Mt @ 748 ppm Total Rare Earth Oxides (TREO) (*see AR3 ASX Release of 30th September 2024*) and is conducting a pre-feasibility study with a \$5 million Australian Government co-funding grant.

This drilling program aims to identify areas of potential with minimum disruptions on private land by locating the holes along roadside verges with local council approvals and purposely widely spaced to cover a significantly large area across the target Loxton/Parilla Sands stratigraphy (**Figure 2**). A total of 30 holes to an average depth of up to 18 metres for 540 metres of drilling has been completed for this program and focussed predominantly on the Coodalya tenement having regards to the results announced on 20 October 2025 for the drilling program of September 2025.

The results of the pXRF scan of the collected samples will be announced in due course when the analysis is completed.

Principal Geologist commented:

“This results from this drilling program for REEs in conjunction with previous drilling results and detailed geological logging will direct our focus for subsequent drilling programs within the pre-approved exploration drilling of up 300 holes for a total of up to 6,000 metres by the Department of Energy and Minerals”.

Table 1 Completed January 2026 Drilling – Kaili Mallee Project

Competent Person Statement

The information in the report above that relates to Exploration Results, Exploration Targets and Mineral Resources is based on information compiled by Mr Mark Derriman, who is the Company's Consultant Geologist and a member of The Australian Institute of Geoscientists (1566). Mr Mark Derriman has sufficient experience that is relevant to the style of mineralization and type of deposit under consideration and to the activities which he is undertaking to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Exploration Targets, Mineral Resources and Ore Reserves. Mr Mark Derriman consents to the inclusion in this report of matters based on his information in the form and context in which it appears.

Forward-Looking Statement

This document may include forward-looking statements. Forward-looking statements include, but are not limited to, statements concerning planned exploration program and other statements that are not historical facts. When used in this document, the words such as “could”, “plan”, “estimate”, “expect”, “intend”, “may”, “potential”, “should” and similar expressions are forward-looking statements. Although Kaili Resources Limited believes that its expectations reflected in these forward-looking statements are reasonable, such statements involve risks and uncertainties and no assurance can be given that actual results will be consistent with these forward-looking statements.

JORC Code, 2012 Edition – Table 1 Limestone Coast (ELs 6856, 6977 and 6978) Drill Collars for Aircore Drilling Program January 2026

Section 1 Sampling Techniques and Data

Criteria	JORC Code explanation	Commentary
Sampling techniques	<i>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</i> <i>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</i> <i>Aspects of the determination of mineralisation that are Material to the Public Report.</i> <i>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</i>	3kg samples were collected in prenumbered calico bags for every meter. - The drilling was completed on the 1st February 2026 - A hand-held Garmin GPS unit was used to record the drill collars as MGA 2020 Zone 54 - OREAS standard 465 and a blank were inserted into the sample sequence every 30th sample. Duplicate samples were also collected every 50th sample
Drilling techniques	<i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>	- Thirty (30) vertical aircore holes completed to 540m - Drilled by GPS Drilling - Drilling along district council verges - Holes not oriented
Drill sample recovery	<i>Method of recording and assessing core and chip sample recoveries and results assessed.</i> <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i> <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>	- A 3kg split was collected for every meter in a pre-numbered calico bag, the remainder of the meter interval put back down the hole as part of the rehabilitation. - Every effort was made by the drillers to maximise recovery. - A representative sample of every meter was collected in pre numbered plastic chip trays - All chip trays and rehabilitation were photographed

Criteria	JORC Code explanation	Commentary
Logging	- Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. - Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. - The total length and percentage of the relevant intersections logged.	- The drill holes have been logged by an experienced geological contractor employed by Perth Based Consultancy Speccy Science(SS) - The detail of the logging is appropriate for the early stage of exploration. - Every meter was logged individually
Sub-sampling techniques and sample preparation	- If core, whether cut or sawn and whether quarter, half or all core taken. - If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. - For all sample types, the nature, quality and appropriateness of the sample preparation technique. - Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples. - Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second-half sampling. - Whether sample sizes are appropriate to the grain size of the material being sampled.	- All samples were collected and placed in prenumbered calico bags. - The meter samples were scanned initially with the Evident Vanta pXRF and based on the pXRF readings and detailed logging selected samples to be sent to ALS for full multi element geochemical analyses - This is appropriate for the early level of exploration and appropriate for the material being sampled.
Quality of assay data and laboratory tests	- The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. - For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. - Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	Only pXRF sampling was completed a partial analyses Evident Vanta - Soil – the following elements were analysed Cu, Pb, Zn, As, Sb, Bi, Hg, P, S, Cl, K, Ca, Ti, V, Cr, Mn, Fe, Co, Ni, Rb, Sr, Y, Zr, Mo, Cd, Sn, W, Th, U, Te, Nb, Sc, Pr, Nd, Ce, La. (These results are not included in the report.
Verification of sampling and assaying	- The verification of significant intersections by either independent or alternative company personnel. - The use of twinned holes. - Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. - Discuss any adjustment to assay data.	- Sample sites were chosen by the Speccy Science Principal Geologist and verified by the site geologist. - All primary data, data entry procedures, data verification and electronic data storage is per Kaili procedures. - All drill collars were based on hand-held GPS sample locations. - Appropriate sampling techniques were used based on discussions with ALS laboratory

Criteria	JORC Code explanation	Commentary
		•
<i>Location of data points</i>	• Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. • Specification of the grid system used. • Quality and adequacy of topographic control.	• All drill collars were initially surveyed using a hand-held GPS accurate to 3 meters. • The grid system used in MGA 2020 Zone 54 with the drill collars located in the field with a hand-held GPS using the MGA 2020 Zone 54 datum. • A collar table is included with the announcement
<i>Data spacing and distribution</i>	• Data spacing for reporting of Exploration Results. • Whether the data spacing, and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • Whether sample compositing has been applied.	• Drill spacing is appropriate for this stage of Exploration. • Sample spacing has been designed to allow appropriate anomaly definition for this early stage of exploration.
<i>Orientation of data in relation to geological structure</i>	• Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. • If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	• Drill traverses have been designed along road verges with available sites for an aircore drilling operation targeting the flat lying Loxton Parilla Sands to a maximum depth of 20m.
<i>Sample security</i>	• The measures taken to ensure sample security.	• All primary data, data entry procedures, data verification and electronic data storage is per Kaili procedures. • All drill collars were based on hand-held GPS sample locations. • Appropriate sampling techniques were used based on discussions with ALS laboratory •
<i>Audits or reviews</i>	• The results of any audits or reviews of sampling techniques and data.	• The sampling technique were reviewed onsite by Speccy Science and the site geologist.

Section 2 Reporting of Exploration Results

(Criteria listed in the preceding section also apply to this section.)

Criteria	JORC Code explanation	Commentary
<i>Mineral tenement and</i>	• Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests,	• Drilling completed within EL 6856 (Lameroo), 6977 Karte and 6978 Coodalya in South Australia, Australia • The tenements are owned by Kaili Gold, Pty Ltd a subsidiary of Kaili

Criteria	JORC Code explanation	Commentary
land tenure status	<i>historical sites, wilderness or national park and environmental settings.</i> <i>The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.</i>	Resources Limited. - The tenements are located in South Australia approximately 200km east of Adelaide - Lameroo and Pinaroo are the nearest towns - There are no JVs and Royalties - There are no Native Title claimants - The tenements are located in the Limestone Coast Inspectorate
Exploration done by other parties	<i>Acknowledgment and appraisal of exploration by other parties.</i>	- Churchill explored for diatomite bearing siltstone in the top of the Parilla sand in the central portion of the licence. - Agricola Minerals for diatomite deposits near the town of Germanium bearing siltstone in the top of the Parilla sand in the central portion of the licence following the work of Churchill who didn't measure absorbencies – no diatomite indicated.. - Iluka Resources explored for heavy minerals across the tenement with rutile and zircon not being abundant.
Geology	<i>Deposit type, geological setting and style of mineralisation.</i>	Loxton/Parilla Sands of the Murray Basin, ionic clay hosted REE mineralisation.
Drill hole Information	<i>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</i> <i>easting and northing of the drill hole collar</i> <i>elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar</i> <i>dip and azimuth of the hole</i> <i>down hole length and interception depth</i> <i>hole length.</i> <i>If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</i>	All drill collar information is included in a Table in the announcement
Data aggregation methods	<i>In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.</i> <i>Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used</i>	No sampling results completed

Criteria	JORC Code explanation	Commentary
	for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. The assumptions used for any reporting of metal equivalent values should be clearly stated.	
Relationship between mineralisation widths and intercept lengths	- These relationships are particularly important in the reporting of Exploration Results. - If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. - If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').	- The potential mineralisation is located in the Murray Basin and the target is the flat or near flat lying Loxton/Perilla sands. - the sampling is appropriate for this level of exploration
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	A table showing the drill collar locations in relation to ELs 6856, 6977 and 6978 is included in the announcement.
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	No sampling results as yet
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	There is no other relevant information to add
Further work	- The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling). - Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.	Infill and extension drilling along the road verges ahead of more closely spaced drilling within freehold land parcels adjacent to the road drilling sited within EL 6856, 6977 and 6978.
